

# 1. Prices in cents or using floating value

## a. Using cents:

**PRO** - avoids decimals calculation issues

**CONS** - misleading for API clients

## b. Using floating values

### **Solution:**

Keep cents for prices. Use this convention on all services that handle prices.

# 2. Release version for services

- Create version (semver) for each service.
- Create tag using the version

### **Issues:**

Docker image version should be in sync with the service version. ( CRITICAL )

### **Next steps:**

Create Jira task, [Former user \(Deleted\)](#) will contact Valiton for Gitlab clarifications.

# 3. Remove service name from repository

### **Current:**

<https://cst-pse-voucherservice-staging.deploy.cybersolutions-tech.com>

### **Proposal**

staging.pse-voucher.cybersolutions-tech.com

## **4. Service URL for Staging / Production**

@see 3

## **5. Separation of messages for API - payload validation / business validation / service messages**

**TODO:** To be discussed

## **6. Production preparation checklist**

- Configuration handling using different environments ( using gitlab configuration features, provisioning docker images for specific environment, vault, AWS SSM )
- Production Monitoring / Alerts / Logging / Reports

**TODO:** Add additional items to the list
