The application uses Jest and Enzyme for unit and component testing. Tests run automatically whenever code is pushed to the repository.

To run tests locally: `npm run test`.

To run tests in watch mode: `npm run test-watch`

ℹ Note: in watch mode, only changed files will be picked up by the test runner

Some gotchas to be aware of:

- Since the project uses styled components, it can be daunting to `.find()` components. One workaround is to name the components you want to search for:
  - how to name a component: [link to file](#)
  - how to access the component via it's name: [link to file](#)

- In order to get the latest state of a component one needs to query for it [instead of saving it in a variable](#)
